# Ketamine Medication Interactions

## Part 2 - Stimulants

Bobbi Leben, MD

# Use with Caution - Stimulants

## *Potential for Reduced Response*

Examples: Amphetamines (Adderall), Methylphenidate (Ritalin), Modafinil (Provigil)

### Considerations:

- Increase dopamine/norepinephrine vs. ketamine's glutamate focus
- May counteract therapeutic effects
- Can raise blood pressure (additive with ketamine)

Management: Take stimulant first, then 4 hours apart from ketamine
